

**NAME**

who – who is on the system

**SYNOPSIS**

**who** [ who-file ]

**DESCRIPTION**

*Who*, without an argument, lists the name, typewriter channel, and login time for each current UNIX user.

Without an argument, *who* examines the */tmp/utmp* file to obtain its information. If a file is given, that file is examined. Typically the given file will be */tmp/wtmp*, which contains a record of all the logins since it was created. Then *who* will list logins, logouts, and crashes since the creation of the *wtmp* file.

Each login is listed with user name, typewriter name (with ‘/dev/’ suppressed), and date and time. When an argument is given, logouts produce a similar line without a user name. Reboots produce a line with ‘x’ in the place of the device name, and a fossil time indicative of when the system went down.

**FILES**

*/tmp/utmp*
