

NAME

mount – mount file system

SYNOPSIS

(mount = 21.)

sys mount; special; name

DESCRIPTION

Mount announces to the system that a removable file system has been mounted on the block-structured special file *special*; from now on, references to file *name* will refer to the root file on the newly mounted file system. *Special* and *name* are pointers to null-terminated strings containing the appropriate path names.

Name must exist already. Its old contents are inaccessible while the file system is mounted.

SEE ALSO

mount(I), umount(II)

DIAGNOSTICS

Error bit (c-bit) set if: *special* is inaccessible or not an appropriate file; *name* does not exist; *special* is already mounted; there are already too many file systems mounted.
