

NAME

ftoo – floating to octal conversion

SYNOPSIS

jsr r5,ftoo; subr

DESCRIPTION

ftoo will convert the floating point number in *fr0* into *ascii* in the conventional octal form

000000;000000;000000;000000

For each character generated by *ftoo*, the subroutine *subr* (supplied by the caller) is called on register *r5* with the character in *r0*.

The *subr* must not disturb any registers.
