

NAME

spline – interpolate smooth curve

SYNOPSIS

spline [option] ...

DESCRIPTION

Spline takes pairs of numbers from the standard input as abscissas and ordinates of a function. It produces a similar set, which is approximately equally spaced and includes the input set, on the standard output. The cubic spline output (R. W. Hamming, *Numerical Methods for Engineers and Scientists*, 2nd ed., 349ff) has two continuous derivatives, and sufficiently many points to look smooth when plotted, for example by *plot* (I).

The following options are recognized, each as a separate argument.

- a** Supply abscissas automatically (they are missing from the input); spacing is given by the next argument, or is assumed to be 1 if next argument is not a number.
- n** Output approximately *n* points, where *n* is given by the next argument. (Default *n* = 100.)
- p** Make output periodic, i.e. match derivatives at ends. First and last input values should normally agree.
- x** Next 1 (or 2) arguments are lower (and upper) *x* limits.

BUGS

A limit of 1000 input points is enforced silently.
