

NAME unspk -- decode voice synthesizer text

SYNOPSIS unspk___ [-] [input [output]]

DESCRIPTION unspk___ is inverse to *speak*. It translates coded voice synthesizer input, as created by *speak*, into phonetic strings of the sort accepted by *speak*. Standard output or input is assumed when one or the other is unspecified.

The -_ option produces output in a different phonetic code for another vocal tract synthesizer [C. H. Coker, Speech synthesis by modelling the human articulatory system, MM69-1232-29].

unspk___ lives in /crp/vs
