

NAME

`neqn` – typeset mathematics on terminal

SYNOPSIS

`neqn` [file] ...

DESCRIPTION

Neqn is an *nroff* (I) preprocessor. The input language is the same as that of *eqn* (I). Normal usage is almost always

`neqn file ... | nroff`

Output is meant for terminals with forward and reverse capabilities, such as the Model 37 teletype or GSI terminal.

If no arguments are specified, *neqn* reads the standard input, so it may be used as a filter.

SEE ALSO

eqn (I), *gsi* (VI)

BUGS

Because of some interactions with *nroff* there may not always be enough space left before and after lines containing equations.
