

NAME

`lpr` – on line print

SYNOPSIS

`lpr` [-] [+] [+-]file ...

DESCRIPTION

Lpr arranges to have the line printer daemon print the file arguments.

Normally, each file is printed in the state it is found when the line printer daemon reads it. If a particular file argument is preceded by +, or a preceding argument of + has been encountered, then *lpr* will make a copy for the daemon to print. If the file argument is preceded by -, or a preceding argument of - has been encountered, then *lpr* will unlink (remove) the file.

If there are no arguments, then the standard input is read and on-line printed. Thus *lpr* may be used as a filter.

FILES

<code>/usr/lpd/*</code>	spool area
<code>/etc/passwd</code>	personal ident cards
<code>/etc/lpd</code>	daemon

SEE ALSO

`lpd` (VIII), `passwd` (V)
