NAME
        chdir − change working directory

SYNOPSIS
        chdir directory

DESCRIPTION
        Directory becomes the new working directory. The process must have execute (search) permis-
        sion in *directory.*

        Because a new process is created to execute each command, *chdir* would be ineffective if it were
        written as a normal command. It is therefore recognized and executed by the Shell.
