NAME

　　　comm − print lines common to two files

SYNOPSIS

　　　comm [− [**123**]] file1 file2

DESCRIPTION

　　　Comm reads *file1* and *file2,* which should be in sort, and produces a three column output: lines only in *file1;* lines only in *file2;* and lines in both files.

　　　The output is written on the standard output.

　　　Flags 1, 2, or 3 suppress printing of the corresponding column. Thus **comm −12** prints only the lines common to the two files; **comm −23** prints only lines in the first file but not in the second; **comm −123** is a no-op.
